FOUR WEEKS / START WITH A NEW WEEK 1

Strength. Skill. Fitness.

Four kettlebell days at home, built around one 16 kg bell and sessions of 20-30 minutes.

Prepared for Manuel, 42, with CrossFit experience and currently pain-free kettlebell training. Goal: maintain muscle and strength while continuing gradual fat loss. The completed week of your earlier program does not count toward this block.

Training approach: simple movements, repeated practice, strength work and rhythmic ballistic work. This is an original plan inspired by Lebe Stark's public approach to home training and hybrid kettlebell practice; it is not an official Lebe Stark program or an endorsement. [1,2]

Day	Focus	Total time, weeks 1 / 2 / 3 / 4
Monday - D1	Strict press, squat, row, carry	27 / 27 / 27 / 20 min
Tuesday - D2	Conversational swings, cleans, carries	21 / 24 / 24 / 20 min
Thursday - D3	Deadlift, horizontal push, row, squat	27 / 27 / 27 / 20 min
Saturday - D4	Clean & jerk, snatch, mixed complex	24 / 24 / 24 / 20 min

Your four-minute warm-up

Minute 1: easy marching and shoulder circles. **Minute 2:** 8 unloaded hinges and 6 comfortable bodyweight squats. **Minute 3:** 5 KB deadlifts and 3 easy cleans per side. **Minute 4:** rehearse the first lift at low effort: 2 presses per side for D1; 5 swings for D2; 3 unloaded kickstand hinges per side for D3; 1-2 clean-and-jerks and snatches per side for D4. Rest for the remaining time. If overhead rehearsal is not easy, use unloaded movement.

Effort and recovery rules

Strength days: approximately 6-8/10 effort, with 2-3 good reps available after each set. **D2:** 5-6/10 and able to speak in full sentences between sets. **D4:** 6-7/10, with crisp catches and no grinding. The weaker side determines the repetitions on both sides.

Keep your current comfortable squat depth. Aim for pain-free work; if discomfort appears, keep it mild (0-2/10), stable, and back to baseline by the next morning. Reduce load exposure, depth or sets if it persists. Stop the provoking movement for sharp pain, swelling, locking or giving way and seek assessment. [3]

Use a clear floor and overhead space. Park the bell under control and switch hands with the bell down when needed. Stop a set when technique, grip or breathing deteriorates. Omit missed work; do not catch up on rest days.

DAY 1 / MONDAY

Press, squat & pull

27 minutes in weeks 1-3. Strength first, with generous recovery inside each minute.

Session clock	Block
00:00-04:00	Four-minute warm-up from page 1
04:00-22:00	Three rounds of the six-minute strength sequence below
22:00-25:00	Three one-minute suitcase carry intervals
25:00-27:00	Easy walking and relaxed breathing

Main block: repeat this six-minute sequence three times

Start each exercise at the beginning of its minute. Finish the prescribed reps within about 40 seconds, then rest. If you cannot preserve roughly 20 seconds of recovery, reduce the repetitions. Minute 6 is a full rest minute.

Minute in round	Movement	Starting dose
1	Left-arm strict press	4-5 reps
2	Right-arm strict press	4-5 reps
3	Goblet squat	8 reps
4	Supported row, left	8-10 reps
5	Supported row, right	8-10 reps
6	Rest	No extra reps

Carry block: three one-minute intervals

Carry or march with the bell at your side for **20 seconds left + 20 seconds right**, then rest for the remaining 20 seconds, including the hand change. Keep your torso upright. A slower hand change simply means a shorter carry.

Execution

Press: clean once into rack, then perform the strict presses without a new clean between reps. Keep the ribs controlled and avoid leaning back. **Squat:** use a comfortable stance and depth; lower smoothly. **Row:** support the free hand on your thigh or a secure surface, keep the trunk still and pull toward the hip.

Week 2: add 1 rep to one selected lift if all sets were comfortable. **Week 3:** add a rep to another lift or repeat week 2. Ceilings: press 6, squat 12, row 12. Keep the same timer and 2-3 reps in reserve. These are ceilings, not mandatory targets.

Week 4 or a 20-minute day

4 min warm-up + 12 min main block (2 rounds) + 2 min carries + 2 min cooldown = 20 min. Use week 1 repetitions during week 4. Each carry minute remains 20 seconds per side with the balance for rest.

DAY 2 / TUESDAY

Swing, clean & cruise

A lighter kettlebell day between strength sessions. Keep the rhythm comfortable.

Week	Warm-up	Main block	Cooldown	Total
1	4 min	5 rounds = 15 min	2 min	21 min
2	4 min	6 rounds = 18 min	2 min	24 min
3	4 min	6 rounds = 18 min	2 min	24 min
4	4 min	4 rounds = 12 min	4 min	20 min

Main block: repeat this three-minute sequence

Minute in round	Movement	Dose
1	Two-handed swing	10 reps; rest for the remainder
2	Single-arm clean	3 left + 3 right; park to switch if needed
3	Suitcase carry or march	20 seconds left + 20 seconds right; rest for the balance

Finish swings and cleans within about 40 seconds. You should be able to speak a full sentence between sets. If the session starts feeling like a hard metcon, reduce the swings to 8 or the cleans to 2 per side, or skip one work interval and resume after recovery.

Execution

Swings: use a hip hinge and let the bell float naturally; shoulder height is enough. **Cleans:** keep the bell close and catch softly in rack. Each clean is a separate repetition; there is no overhead press today. **Carries:** use relaxed, short steps and a quiet trunk.

Progression

Week 1: establish a repeatable rhythm. **Week 2:** add the sixth round, keeping the same reps. **Week 3:** if effort stays at 5-6/10, choose either 12 swings or 4 cleans per side. Do not increase both. **Week 4:** return to 10 swings and 3 cleans per side for four rounds.

Week 1 dose: 50 swings and 15 cleans per side. **Week 2 dose:** 60 swings and 18 cleans per side. Leave the session feeling capable of more. This day supports work capacity and skill practice while keeping overhead recovery available.

Any-week 20-minute version

4 min warm-up + 12 min main block (4 rounds) + 4 min easy walking and breathing = 20 min. Use the starting repetitions. Do not speed up to squeeze in additional rounds.

DAY 3 / THURSDAY

Hinge, push & build

27 minutes in weeks 1-3. Controlled strength, a horizontal push and additional leg work.

Session clock	Block
00:00-04:00	Four-minute warm-up
04:00-22:00	Three rounds of the six-minute sequence below
22:00-25:00	Three one-minute goblet squat intervals
25:00-27:00	Easy walking and relaxed breathing

Main block: repeat this six-minute sequence three times

Start on the minute, complete the reps within about 40 seconds, then rest. Allow time for safe floor transitions. Use fewer reps if needed; the clock is a limit, not a race.

Minute in round	Movement	Starting dose
1	Kickstand Romanian deadlift, left leg forward	8 reps
2	Kickstand Romanian deadlift, right leg forward	8 reps
3	Single-arm floor press, left	6-8 reps
4	Single-arm floor press, right	6-8 reps
5	Supported row, left	8-10 reps
6	Supported row, right	8-10 reps

Squat block: three one-minute intervals

At the start of each minute, perform **8 goblet squats** at a comfortable depth, then rest for the remaining time. Use smooth, controlled lowering and normal breathing.

Execution and substitutions

Kickstand RDL: rear toes provide balance; load the front leg, keep a soft knee and send the hips back. Start with a bilateral RDL if balance interferes. **Floor press:** use both hands to position the bell safely, keep the forearm vertical and touch the upper arm gently to the floor. Use only a setup you know.

If the floor press is unfamiliar: perform 6-15 push-ups in minute 3 and take minute 4 as full rest. Elevate the hands on a secure surface if necessary. The rest of the timer stays the same.

Week 2: add 1 rep to one selected movement. **Week 3:** add a rep to another movement or repeat week 2. Ceilings: RDL 10 per side, floor press 10 per side, row 12 per side, squat 10. Maintain 2-3 good reps in reserve and the 40-second work limit.

Week 4 or a 20-minute day

4 min warm-up + 12 min main block (2 rounds) + 2 min squats + 2 min cooldown = 20 min. During week 4, use starting repetitions and 6-8 squats per squat interval.

DAY 4 / SATURDAY

Power & athletic flow

24 minutes in weeks 1-3. Jerks and snatches stay in the plan, with recovery between short clusters.

Session clock	Block
00:00-04:00	Four-minute warm-up
04:00-22:00	Nine two-minute stations: A, B, C repeated three times
22:00-24:00	Easy walking and relaxed breathing

Main block: start a station every two minutes

Station	Sequence	Starting dose
A / clean & jerk	Clean-and-jerk left, park, then right. Each rep includes a clean and a jerk.	3 reps per side
B / snatch	Snatch left, park, then right. Use your established, comfortable snatch technique.	4 reps per side
C / mixed complex	Two-handed swings, park; goblet squats, park; row left, then right.	10 swings + 6 squats + 6 rows per side

Starts within the 18-minute main block: A at 0:00, B at 2:00, C at 4:00; A at 6:00, B at 8:00, C at 10:00; A at 12:00, B at 14:00, C at 16:00. Finish the block at 18:00.

Work, park, recover

Complete each station within **90 seconds maximum** and rest for the remainder of its two-minute window. A and B will often finish much sooner. Allow the extra recovery. You may park between sides or movements; no station must be unbroken. Keep the session around 6-7/10 effort.

Progression and technique

Weeks 1-2: keep the starting dose. **Week 3:** choose either 4 clean-and-jerks per side or 5 snatches per side, provided catches, knee response and effort remain comfortable. Keep station C unchanged. **Week 4:** return to starting doses and complete two rounds only.

Use your normal comfortable jerk dip and a controlled overhead fixation. Let breathing settle between stations. If the jerk dip irritates your knee, substitute 3 strict presses per side. If snatch grip or catches deteriorate, substitute 4 cleans per side; if overhead movement itself hurts, omit it and use a comfortable non-overhead movement.

Starting main-block totals: 9 clean-and-jerks and 12 snatches per side; 30 two-handed swings; 18 goblet squats; 18 rows per side. There is no additional finisher.

Week 4 or a 20-minute day

4 min warm-up + 12 min main block (A/B/C twice) + 4 min cooldown = 20 min. Keep the two-minute station starts and starting repetitions.

PROGRESSION / RECOVERY / TRAINING LOG

Make the work repeatable.

Track a few useful signals: repetitions, effort, next-morning knee comfort and recovery.

Week	Progression
1 / establish	Use starting reps. D2 has 5 rounds. Keep all work repeatable.
2 / build	On D1 and D3, add 1 rep to one lift if ready. D2 rises to 6 rounds. D4 stays the same.
3 / consolidate	D1/D3: progress one further lift or repeat. D2: choose one rep increase. D4: choose jerk OR snatch increase. Keep effort limits.
4 / recover	Use the 20-minute version of every day and starting reps. No maximum tests.

All progression is conditional: keep the previous dose if sleep, appetite, technique or knee response worsens. If a set becomes too easy at the repetition ceiling, a brief pause or slower lowering on a strength lift can increase difficulty. Preserve rest and the work-time cap. One 16 kg bell will eventually limit some strength progress.

Support muscle: continue gradual weight loss rather than adding aggressive restriction. Aim for 110-130 g protein/day if no clinician restriction, and regular sleep. Adequate protein plus resistance training supports muscle retention during GLP-1 treatment. [4] On days with significant nausea, poor intake or dehydration, reduce or postpone training. Report unusual muscle weakness or pain to your prescriber; severe symptoms or dark urine need urgent assessment.
